

Do it yourself

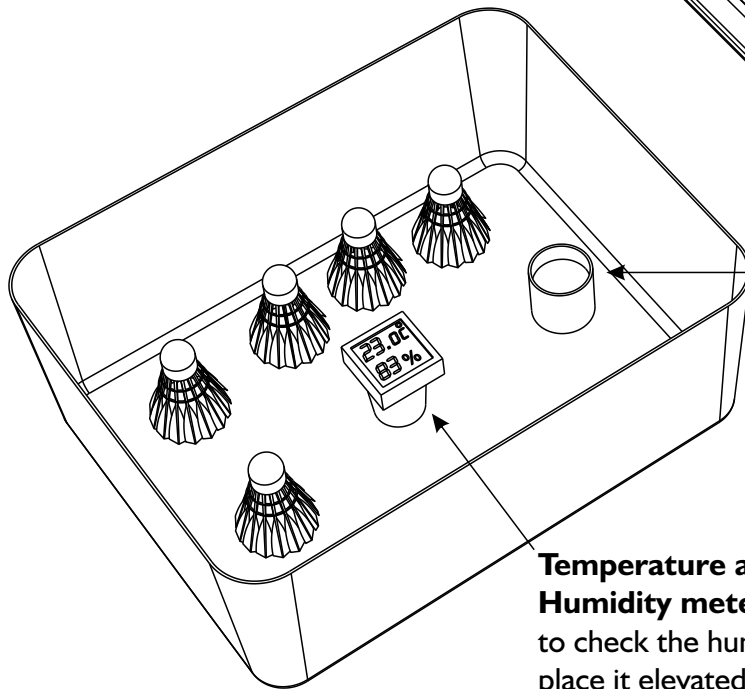

BADMINTON SHUTTLECOCK HUMIDOR

SAVE UP TO 50% IN SHUTTLECOCK COSTS

Requires no electricity, totally silent, cheap,
low maintenance, easy to build, super effective

"I have played badminton for over 20 years, and during this time shuttlecock prices have risen all the time and quality has varied, and hardly ever matched the price. Even when shuttles fly in test shots perfectly they break or get slower almost immediately after, which drove me to develop this DIY humidor. Simply on rainy days shuttles last better because of the increased humidity. With this humidor your shuttles are always humid enough, no matter what!"

Transparent plastic box and lid
(Size 50 x 39 x 18 cm)

Little plastic cup,
diameter ~ 5 cm
filled with water and
taped to the box to avoid
spilling if humidor is moved
Fill when needed
(usually once every 1-2 months)

**Temperature and
Humidity meter (optional)**
to check the humidity level,
place it elevated on the top of plastic cup

How to use:

- Little plastic cup that creates humidity must have water all the time (humidity should stay over 80%).
- Add small amount of dishwashing liquid to the little plastic water cup to prevent possible mold
- Humidor lid must be closed immediately after taking or placing shuttlecocks to keep the humidity.
- Keep the humidor away from sunshine, heaters in place where it is not moved by accident (water spill).
- Shuttlecocks must be placed the cork upwards (as shown in the image) to distribute the humidity evenly.
- There is no need to keep humidor cooled, it works just fine in room temperature (tested).
- Shuttlecocks should be kept at least one week in the humidor before use, to gain enough humidity.
- Shuttlecocks have usually all kind of chemicals to prevent mold, in case you detect any, clean the humidor.
- **Take shuttles from the humidor when you go to play and return the unused ones back to humidor when you return.**
